

The Wheel Specialist

Magnesium Wheel Repair Policy

Magnesium wheels are prone to corrosion damage and deep pitting caused by oxidation on the wheel. Corrosion can occur underneath an existing coating/finish that may appear to be in a reasonable state, thus not visible until preparation of the wheel is fully under way. This can affect the overall finish achieved.

The Wheel Specialist have developed a technique that will help seal the wheel prior to applying our powder coat and wet paint combination finishes however we cannot guarantee Magnesium wheel finishes/repairs under the standard TWS Guarantee policy. We do however guarantee the powder coat finish for six months.
